this report describes an investigation of the tensile flexural and impact properties of 10 selected types of phenolic molding materials the materials were studied to see in what ways and to what extent their properties satisfy some assumptions on which the theory of strength of materials is based namely a isotropy b linear stress strain relationship for small strains and c homogeneity the effect of changing the dimensions of tensile and flexural specimens and the span depth ratio in flexural tests were studied the strengths of molded boxes and flexural specimens cut from the boxes were compared with results of tests on standard test specimens molded from the respective materials

the testing of unsaturated soils requires greater care and effort than that of saturated soils although unsaturated soil mechanics has been embraced by geotechnical engineering engineering practice has not yet caught up as the characterization of unsaturated soils is difficult and time consuming and made harder still by a lack of standards laboratory tests for unsaturated soils collates test procedures to cover all laboratory tests for characterising unsaturated soils it covers the background theory test procedures and interpretation of test results each test procedure is broken down into simple stages and described in detail the pitfalls of each test and the interpretation of the test results are explained test data and calculation methods are given along with many numerical examples

to illustrate the methods of interpretation and to offer the presentation of typical results the book is especially useful for students and researchers who are new to the field and provides a practical handbook for engineering applications
